5.2	GLOSSARY	22

1. Overview

Cloud9 Payment Gateway provides a simple method of processing payment transactions for merchants who want to integrate payment processing with their existing applications. The Cloud9 Payment Gateway processes credit card, debit card and Electronic Benefits Transfer (EBT) transactions. Transactions are accepted from various industries including: retail, restaurant, mail order/telephone order, lodging, and E-comm.

This document describes how to write your own application for processing payment transactions or integrate payment processing capabilities into an existing application.

1.1 System Requirements

The Software Development Kit (SDK) does not require any special system requirements for usage. You are free to develop your application using any desired tools on any operating platform.

1.2 Software Development Kit (SDK)

The Software Development Kit, which includes this document, provides the guidance for developing an application that can send card-based payment transactions to the Cloud9 Payment Gateway and receive the response returned by the Cloud9 Payment Gateway. The methods of communicating with the Cloud9 Payment Gateway are through Simple Object Access Protocol (SOAP).

An itemized list of the contents of the SDK includes:

- Cloud9 FrontEnd SDK Guide (this document)
- XML Schema (PosGatewayService.wsdl)
- SoapUI Sample XML Messages

1.3 Audience

This document is for Software Developers that need guidelines and procedures for processing transactions within the Cloud9 Payment Gateway.

1.4 Simple Object Access Protocol (SOAP)

To simplify the message specification, the Heartland Portico Gateway uses the SOAP for its message delivery. SOAP is a protocol for exchanging XML-based messages over a computer network. It provides a method of communication between applications running in different environments.

- A SOAP message is simply an XML document that contains the following elements:
- A required **Envelope** element that identifies the XML document as a SOAP message.
- An optional **Header** element that contains header information.
- A required **Body** element that contains call and response information.
- An optional **Fault** element that provides information about errors that occur during the processing of a message.

All of these elements are declared in the default namespace for the SOAP envelope. For more details, refer to <http://www.w3.org/2001/12/soap-envelope>.

The default namespace for SOAP encoding and data types is:

<http://www.w3.org/2001/12/soap-encoding>.

1.5 Connectivity

To simplify development, the Cloud9 Payment Gateway provide a midware called FrontEnd to communicate with Payment Gateway. The connectivity method to the Cloud9 Payment Gateway is through the Internet.

1.6 Security

Each type of message uses a secure socket connection to ensure the confidentiality of information passed between the merchant and Cloud9 Payment Exchange. By doing this, credit card information is never accessible to external entities.

2. Transaction Type

2.1 Sale

A **Sale** transaction authorizes a sale purchased. This action decreases the cardholder's limit to buy. It authorizes a transfer of funds from the cardholder's account to merchant's account.

2.2 Auth

An **Auth** transaction places a temporary hold on the customer's account. Approvals on authorizations are used later to transfer funds by Finalize or AddTip.

2.3 Inquiry

An **Inquiry** transaction is used to query the balance amount of a card.

2.4 Refund

A **Refund** transaction is used to authorize a refund to a customer's credit card account.

2.5 Finalize

A **Finalize** transaction is used to change an Auth transaction to sale transaction.

2.6 AddTip

An **AddTip** transaction is used to add an additional amount to an original transaction, Auth or Sale. If the original transaction is Auth, this operation transfers the Auth to Sale.

2.7 Modify

A **Modify** transaction is used to alter the transaction amount of an original transactions, Auth or Sale. If the original transaction is Auth, this operation transfers the Auth to Sale.

2.8 Void

A **Void** transaction is used to cancel an authorized transaction before it has been settled.

2.9 Batch

A **Batch** transaction is used to close the current open batch and settle it.

3. Data Groups

This chapter provides detailed information for data groups of SOAP message. A data group consists of multiple fields.

3.1 Configure Group

NOTE: This subgroup is used for all transactions.

Field Name	Data Type	Usage	Description
GMID	String	Required	Merchant identifier Assigned by Cloud9 Payment Systems Administrator during registration
GTID	String	Required	Merchant's terminal identifier Assigned by Cloud9 Payment Systems Administrator during registration
GMPW	String	Required	Password for user, reserved for future use
AllowsPartial Auth	String	Optional	Indicates whether partial authorization is allowed Valid values = Y or N Default is "N"

3.2 Request Amount Group

NOTE: This subgroup is only used for Auth/Sale/Refund/Addtip transactions.

Field Name	Data Type	Usage	Description
MainAmt	Decimal	Optional	Primary charge amount Total digits = 12 (10 before the decimal and 2 after)
TipAmt	Decimal	Optional	Tip amount that is in addition to the main amount Total digits = 12 (10 before the decimal and 2 after)
IncTaxAmt	Decimal	Optional	Tax amount that is included in the main amount Total digits = 12 (10 before the decimal and 2 after)
IncCashBack Amt	Decimal	Optional	Cash back amount that is included in the main amount Total digits = 12 (10 before the decimal and 2 after)
TaxIndicator	String	Optional	Additional Information about TaxAmt Valid values = "Nptrvd", "NonTax" and "Prvded" Default is " Prvded"

3.3 Action Group

NOTE: This subgroup is used for all transactions.

Field Name	Data Type	Usage	Description
TransType	String	Required	Transaction Type Valid values include: Auth Sale Finalize Addtip Void Refund Inquiry
IsOffline	String	Required	Indicates whether is an offline transaction Valid values = Y or N Default is "N"

3.4 Request Extend Info. Group

Field Name	Data Type	Usage	Description
InvoiceNum	String	Optional	Invoice Number
OrderNum	String	Optional	Order Number Only used for purchase card
AuthCode	String	Optional	Offline auth code Only used for offline transaction
VoucherNum	String	Optional	Voucher serial number Only used for offline EBT transaction

3.5 Trace Group

NOTE: This subgroup is used for all transactions.

Field Name	Data Type	Usage	Description
SourceTraceNum	String	Required	Source Trace number Provided by the merchant and it uniquely identifies a transaction.
GTRC	String	Optional	Gateway trace It is a unique trace number assigned to a transaction by Cloud9 payment and returned in the response message. The POS must submit it back for Void/Addtip/Finalize etc based previous transactions.

3.6 Request Card Info. Group

NOTE: This subgroup is only used when card info is from POS, not FrontEnd.
And the item,NeedSwipeCard, must be "N".

Field Name	Data Type	Usage	Description
Medium	String	Optional	Card Type. Valid values include: Credit/ Debit /EBT Food/EBT Cash/Prepaid/Gift
AccountNum	String	Optional	Card number. Maximum length = 22
ExpDate	String	Optional	Card expiration Date MMYY
CVVNum	String	Optional	Card verification code on the card Maximum length = 6
Track1	String	Optional	full magnetic Track I data read from the card by a card reader.
Track2	String	Optional	full magnetic Track II data read from the card by a card reader.
PinData	PINGrp	Optional	Must be present when Pin is passed
EncryptionData	Encryption DataGrp	Optional	Must be present when account number is encryptrd
CardPresent	String	Optional	Indicates whether is card is present Valid values = Y or N.Default is "Y"
CommercialCard	String	Optional	Indicates whether is card is Commercial Card. Valid values = Y or N. Default is "Y"

3.7 Encryption Data Group

Field Name	Data Type	Usage	Description
KeyID	String	Optional	This is an identifier used to retrieve the private key, which is required for decryption.
EncrptTrgt	String	Optional	Indicates the type of data that is being encrypted. Valid Values = Track1 ,Track2 and PAN
EncrptBlock	String	Optional	Contains the track data or card number provided in an encrypted block. Be Present when card data is encrypted.

3.8 PIN Group

Field Name	Data Type	Usage	Description
PinBlock	String	Optional	Contains the Encrypted PIN Block for the Debit or EBT transaction being submitted
KSN	String	Optional	used to create the base PIN encryption key for DUKPT PIN Debit and EBT transactions. Mandatory for PIN Debit and EBT transactions.

3.9 Result Group

Field Name	Data Type	Usage	Description
AuthCode	String	Optional	Auth code is assigned by the association, issuing bank, or Debit/EBT network.
Status	String	Required	Indicates whether transaction success. Valid values include fail, success, timeout, cancel and invalidData.
ResponseCode	String	Required	The host response to a string number to indicate the status of the transaction.
ResponseText	String	Required	The host response to a message to describe the status of the transaction.
AVSResultCode	String	Required	If address verification requested, address verification result code returned by the Issuer
CCVResultCode	String	Required	If card verification was provided in the request, card verification result code provided by the Issuer

3.10 Response Amount Group

Field Name	Data Type	Usage	Description
AuthAmt	String	Optional	Approval amount
BalanceAmt	String	Optional	If supplied from the Issuer, the available balance on the associated prepaid, EBT, or gift card

3.11 Response Card Info.

Field Name	Data Type	Usage	Description
Medium	String	Optional	Card Type. Valid values include: Credit/ Debit /EBTFood/EBT-Cash/Prepaid/Gift
Brand	String	Optional	Card brand Valid values include:Visa/Master/Discover/Amex/JCB and so on
AccountNum	String	Optional	Card number Maximum length = 22

4. XML Message Sample

4.1 Sale

4.1.1 Sale Request

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:sof="http://www.911software.com/">
